A; Title: The amino acid sequence of the carboxyterminal nonhelical cross link region of t
A; Reference number: A43048

A,Accession: A43048 A,Molecule type: protein A,Residues: 759-779 <RA2>

A;Title: The covalent structure of collagen. Amino acid sequence of peptide alphal-CB6-C; A;Reference number: A91200; MUID:73042275; PMID:4343807

A; Accession: A91200

Experimental source: Skin (274, 346, 424, 496, 658, and 670 may be hydroxy comment: Lysines at positions 115, 124, 274, 346, 424, 496, 658, and 670 may be hydroxy cycomment: Prolines in the third position of the tripeptide repeating unit (G-X-Y) are hy (CCOmment: Prolines in the third position of the alpha 1(1) chain of bovine skin or 9, 149, 268, and 217 residues.

Cycomment: The complete chain contains 1052 residues.

Cycomment: The complete chain contains 1052 residues.

Cycomment: The complete chain sontains 1(1) chain; fibrillar collagen carboxyl-terminal homology; Cykeywords: colled coll; extracellular matrix, glycoprotein; pyroglutamic acid; trimer; F;1/Modified site: pyrrolidone carboxylic acid (Gln) #status experimental

A)Molecule type: DNA
A)Molecule the authors translated the codon GAA for residue 1460 as Gln, and GAG for residu Comment: Prolines and lysines at the third position of the tripeptide repeating unit (are 5-hydroxylated and subsequently O-glycosylated.
C)Comment: The amino-terminal propeptide domain appears not to be completely cleaved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A.Cross-references: GDB:119064; OMIM:120190

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 18, Reducing the sequence 19, Reducing the sequence 21, Reducing the sequence 11, Reducing the sequence 19, Reduc

GENERAL INFORMATION:
APPLICANT: Meristem Therapeutics, S.A.
APPLICANT: Meristem Therapeutics, S.A.
TITLE OF INVENTION: Recombinant Collagens and Derived Proteins Produced by Plants, N TITLE OF INVENTION: Obtaining Such and Their Uses
TILE REPERBUCE: 1149-3
CURRENT APPLICATION NUMBER: US/09/331,347C
CURRENT FILING DATE: 1999-08-17
NUMBER OF SEQ ID NOS: 22
SOFTWARE: PatentIn version 3.1
APPLICANT: Olsen, David R
APPLICANT: Chang, Robert
APPLICANT: Chang, Robert
APPLICANT: Chang, Robert
APPLICANT: McMullin, Hugh
APPLICANT: Hitzeman, Romald A.
APPLICANT: Chisholm, George
TITLE OF INVENTION: NOVEL METHODS FOR THE PRODUCTION OF GELATIN AND
TITLE OF INVENTION: FULL.LENGTH TRIPLE HELICAL COLLAGEN IN RECOMBINANT
TITLE OF INVENTION: CELLS
FILE REFERENCE: 225002030400
CURRENT PAPLICATION NUMBER: US/09/289,578
CURRENT PILING DATE: 1999-04-10
PRIOR APPLICATION NUMBER: 60/084,828
PRIOR PLLING DATE: 1998-05-08
NUMBER OF SEQ ID NOS: 11
SCPTWARE: Patentin Ver. 2.0

for The present sequence represents a human recombinant gelatin polypeptide. The recombinant gelatin polypeptide is used to produce vaccine formulations of the invention. The recombinant human gelatin is non-immunogenic (therefore reducing anaphylactic reactions) and confers stability at ambient temperatures. The vaccine formulation comprises a vaccine formulated for the prevention of a disease selected from vaccinia virus (small pox), polio virus (salk and Sabin), mumps, measles, rubella, Vaccine formulations (I) comprising recombinant human gelatin, useful for vaccinating against e.g. mumps, measles, rubella, tetanus, rabies and cholera, the gelatin is non-immunogenic and confers stability at ambient /note= "this residue is given as unknown as illegible in the specification" Polarek JW; Amino acid sequence of a recombinant human gelatin. Human; gelatin; vaccine; anaphylactic reaction. Olsen DR, Claim 11; Page 114-116; 130pp; English. The patent discloses recombinant human gelatin which is useful in various compositions including binding agents, encapsulants, stabilising agents, film-forming agents, moisturising agents, enclands film agents, colloidal agents, adhesive agents, pharmaceutical compositions, hard gel capsules, soft gel capsules, pharmaceutical compositions, harmaceutical stabilisers, micro-carriers, edible compositions, protein supplements, fat substitutes, nutritional compositions, protein supplements, fat substitutes, nutritional compositions, industrial composition, cell culture compositions and compositions for use in the laboratory. Pharmaceutical compositions and compositions such as architis, athrosis and other compising recombinant gelatin are used as vaccines. They are also used to treat various joint conditions such as arthritis, athrosis and other conditions related to the degeneration of cartilage and joint fluctures. The present sequence is human alphal (1) type I collagen industries. The present sequence is human alphal (1) type I collagen belical domain (residues 179-679). This sequence is a recombinant gelatin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              339

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by the cell; of that cell for naturally occurring codons not preferred by the cell; incorporating the mucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid; selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxyplation of proteins emethod is also useful in studying the structure and function of proteins because the structure and structure and structure and structure and structure the structure and structure and structure and structure and s
  trans-4-hydroxyproline, 3-hydroxyproline, recombinant protein production; collagen; fibrinogen; fibronectin; post translational hydroxylation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Production of extracellular matrix proteins containing 4-trans-hydroxyproline results in native self aggregating proteins, useful on medical implants.
                                                                                                                                                                                                                                                                                                                                                     Connolly K;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes a vaccine composition comprising a recombinant gelatin, and an antigenic agent. The vaccine can be delivered by infection, through masal, oral, transdermal or mucosal routes, or through dependences. Intravention of the composition intestinal, or parenteral (e.g. intraventicular, intraventicular, subcutaneous, intranedullary, intraocentescial, intraventicular, intraventicular, intraperitones, intranedullary, intraocentericular, intravences, intraperitones, intranedullary, intraocentar injection). The vaccine composition is formulated for the prevention of vaccinia virue (small pox), polio virue (salk and Sabin), mumps, meaales, rubella, diphtheria, tetanus, Varicella-Zoster (chicken pox/shingles), pertussis (whopping cough), Bacille Calmette-Guerin (BCG, tuberculosis), Haemophilus influenze meniggitis, rabies, cholera, dapances encephalitis virus, influence meningitis, rabies, cholera, dapances encephalitis virus, salmonella typhi, Shigella hepatitis A, hepatitis B, adenovirus, yellow fever, foot and mouth disease, hepres simplex virus, respiratory syncytial virus, rotavirus, dengue, Mest Nile virus, Turkey herpes virus (Marek's disease), influenza, and anthrax. This is the amino acid sequence of a recombinant gelatin used in the creation of a vaccine composition of the invention.
                                                                                                                                                                                                                                                                                                    New vaccine composition comprising a recombinant gelatin and an antigenic agent, useful for preventing e.g. polio virus, mumps, measles, rubella, diphtheria, tetanus, chicken pox/shingles, pertussis, cholera, rotavirus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   280 GPPGPAGEEGKKGARGEPGPTGLPGPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGPA 339

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins the sespecially useful in the recombinant production of proteins such as collagen, fibrinogen and proteins depends on the post translational hydroxylation of proline. The method is also useful in studying the structure and function of proteins depends which do not normally contain trans-4-hydroxyproline. The present sequence represents human collagen 1 (alphal) helical region, which may be produced using the method of the invention
                                                                                                                                              Extracellular matrix protein; self aggregation; hydroxylated proline; trans-4-hydroxyproline; 3-hydroxyproline; recombinant protein production; collagen; fibrinogen; fibronectin; post translational hydroxylation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Production of extracellular matrix proteins containing 4-trans-hydroxyproline results in native self aggregating proteins, useful on medical implants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match 97.0%; Score 1149; DB 3; Length 1057; Best Local Similarity 93.6%; Pred. ```
The present sequence represents a human type 1 (alphal) collagen protein. Peptides derived from the protien were used to demonstrate incorporation of 3.4-derydron-brolline into the peptide, using the method of the invention. The specification describes a method for the incorporation non-natural amino acid into a polypeptide. The method comprises reacting at least one 3.4-derydroprolline residue in the polypeptide with an epoxyprolline residue. The method is used for studying the effects of non-natural amino acids on structure and function of polypeptides. The method is also useful for commercial production of collagen or mussel adhesive proteins (which are useful as bloadhesives), and for incorporating a wice variety of groups, including therapeutic ligands and biological probes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      109 GVMGFPGPKGAAGEPGKAGERGVPGPPGAVGPAGKDGEAGAQGPPGPAGPAGERGEQGPA 168

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chimaeric DNA encoding protein contg. extracellular matrix protein domain - and cellular regulatory factor domain, partic. useful as osteogenic agents, also related vectors, transformed cells and chimaeric proteins.
A fusion protein (AAR89472) comprises the alpha-helical region of human collagen I(a) linked to amino acids 46-93 of human mature dermatan sulphate proteoglycan (decorin). It can be expressed in Escherichia colitransformants carrying a vector incorporating a chimeric gene (AAT16518) coding for the fusion. The decorin binds to type I collagen and thus affects Elbril formation. It inhibits the cell attachment-promoting activity of collagen and fibrinogen by binding to such molecules near their cell binding sites. The collagen moiety provides an integral substratum or scaffolding for the decorin. The fusion protein acts to reduce scarring of healing tissue
                                                                                                                                                                                                                                   Transforming growth factor; TGF-beta-1; collagen IA; osteogenesis; bone formation; tissue repair; fusion protein.

```
matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily dydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated
                                                                                                                                                                                     476
                                                                         108

                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                  method may be used to make host cells assimilate and incorporate trans-4-
hydroxyproline into proteins. This is especially useful in the
ecombinant production of proteins such as colladen, fibrinogen and
fibronectin whose ability to self aggregate and produce functional
proteins depends on the post translational hydroxylation of proline. The
method is also useful in studying the structure and function of
polypeptides which do not normally contain trans-4-hydroxyproline. The
present sequence represents a chimeric collagen 1 (alphal)/decorin
protein, which may be produced using the method of the invention
                                                                                                                                                                                                                               356

1,
                               and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer and non-cancerous disease states of the pancreas. The present sequence is that of a human pancreatic protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               108

                                                                                                                                          A fusion protein (AAR89469) comprises the alpha-helical region of human collagen I(a) linked to the human mature bone morphogenic protein 2B (BMP2B). It can be expressed in Escherichia coli transformants carrying evector incorporating a chimeric gene (AAT16515) coding for the fusion. The BMP moiety induces osteogenesis, while the collagen moiety provides an integral substratum or scaffolding for the BMP and cells involved in reconstruction and growth. The fusion protein provides sustained release and delivery of BMP to a target tissue
                                                                                                                                                                                                                                                                                                                                                                                                  48

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid equence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; in corporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxylation of proteins centod is also useful in studying the structure and function of proteins collagent (applat) (bone of the annual trans-4-hydroxyproline) or the post translational hydroxyproline. The present sequence represents a chimaric collagen (applat) (bone or the post collagen) (applat) (applat)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 108

Chimaeric DNA encoding protein contg. extracellular matrix protein domain - and cellular regulatory factor domain, partic. useful as osteogenic agents, also related vectors, transformed cells and chimaeric proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A fusion protein (AAR89470) comprises the alpha-helical region of human collagen I(a) linked to the human mature transforming growth factor beta-(1) if can be expressed in Escherichia coll transformants carrying a vector incorporating a chimeric gene (AAT16516) coding for the fusion. The TGF-beta- moiety increases efficacy of the body's normal soft tissue repair response and also induces osteogenesis. The collagen moiety provides an integral substratum or scaffolding for the TGF and cells involved in reconstruction and growth. The fusion protein provides sustained release and delivery of TGF-beta-1 to a target tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              297 GPPGPAGEEGKRGARGEPGPTGLPGPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGPA 356

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by the cell; on corporating the nucleic acid sequence into the cell; and contacting the incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-chydroxyproline and along the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and proteins depends on the post translational hydroxylation of proteins. The method is also useful in studying the structure and function of proteins component method is also useful in studying the structure and function of proteins depended to not normally contain trans-4-hydroxyprolline. The present sequence represents chimeric collagen 1 (alphal/transforming the present sequence represents chimeric collagen 1 (alphal/transforming the collagen by the cells of the collagen in the produced using the collagen in the collagen in the produced using the

This invention relates to novel nucleic acids and proteins present in normal and neoplastic pancreatic cells. Pancreatic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer and non-cancercous disease states of the pancreas. The present sequence is that of a human pancreatic protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New pancreatic specific nucleic acid molecule or protein for diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer or non-cancerous disease states of the pancreas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      109 GVMGFPGFKGAAGEPGKAGERGVPGFPGAVGPAGKDGEAGAQGFPGPAGPAGERGEQGFA 168

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to novel nucleic acids and proteins present in normal and neoplastic pancreatic cells. Pancreatic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer and non-cancerous disease states of the pancreas. The present sequence is that of a human pancreatic protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 GPP-----GEPGPTGLPGPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGPA 48
